New study shows that emergency paid sick leave reduced COVID-19 infections in the United States

The United States is one of three high-income nations that does not guarantee paid sick leave for workers. As of March 2020, 25 percent of private-sector workers had no access to paid sick leave. This number is higher for part-time workers (55 percent) and low-income workers (69 percent).

Without access to paid sick leave, employees who are financially constrained may show up to work sick. When that happens, they risk passing their illness to others and impose costs on employers through lost productivity.

Several studies demonstrate how paid sick leave guarantees at the state and local level can benefit public health and improve worker productivity, with one recent study finding an 11 percent decline in flu-like illnesses in the first year after such a guarantee was enacted into law.

When the coronavirus pandemic hit the United States, the U.S. Congress recognized that paid sick leave supports public health and economic well-being, and passed the Families First Coronavirus Response Act on March 18, 2020. The new law, part of several measures to support the economy and health of the nation against the coronavirus and COVID-19, the disease caused by the virus, allows qualified workers across the country who are affected by COVID-19 to take up to 2 weeks of sick leave at full pay.

Now, a new study published in *Health Affairs* shows that the law was successful in “flattening the curve” of COVID-19 transmissions and was associated with approximately 400 fewer cases of COVID-19 per day in states where the law gave workers new access to guaranteed sick leave. While no one study is definitive, it offers some of the first evidence of the law’s efficacy in supporting public health.

### Key takeaways

- Paid sick leave is an important public health tool in the fight against COVID-19, reducing infections by 400 cases per day in states that previously had no paid sick leave guarantee.

- Extending paid sick leave benefits beyond December 2020, when the current emergency benefits expire, would ensure that the United States has this necessary public health tool for the duration of the pandemic.

- If more people are eligible for paid sick leave, including people employed by larger firms who are currently ineligible for emergency paid leave under the new law, then it is likely even more cases would be prevented.

### About this new study in *Health Affairs*

- Looking at the period of March 6, 2020–May 11, 2020, the researchers find that states where workers gained new access to guaranteed paid sick leave through the Families First Coronavirus Response Act saw a statistically significant 400 fewer
confirmed COVID-19 cases per day. This translates to a 56 percent decrease in infections in these states.

To arrive at these findings, the authors compared infection rates before and after the passage of the new law in states with existing paid sick leave guarantees (the control group) and states without such a guarantee (the treatment group). The authors also controlled for state populations, testing capacities, state and local policies such as stay-at-home orders, and other geographic and temporal factors. (See Figure 1.)

These findings are in line with research conducted prior to the pandemic reporting similar 30 percent to 40 percent declines in influenza-like infections following the implementation of various local paid sick leave ordinances.

While 89 percent of workers at large firms already have access to paid sick leave through their employers, that leaves an estimated 6.5 million workers without any employer-provided sick leave.

Policy implications

- Extending access to emergency paid sick leave through 2021 would ensure that the United States benefits from this important public health tool through the expected duration of the pandemic. Currently, access to emergency paid sick days is set to expire on December 31, 2020, yet experts say the pandemic will stretch on past that date. Additionally, a permanent paid sick leave guarantee, such as the one proposed in the Healthy Families Act, would ensure that workers can keep these protections beyond the current public health crisis.

- Expanding access to emergency paid sick leave could yield even greater public health benefits than those identified in this latest study. Closing the coverage gap for workers at large firms would likely yield even greater public health benefits. The HEROES Act, passed by the U.S. House of Representatives on May 15, 2020, would eliminate this carve out for large businesses.

Conclusion

Building on prior research on the public health and economic benefits of paid leave, this new study demonstrates that sick leave through the Families First Coronavirus Response Act played an important role in flattening the curve of COVID-19 transmissions in the early months of the coronavirus pandemic. Expanding and extending access to these benefits could have critical public health implications in 2021 and beyond.
The Health Affairs study presents early insight into how paid leave is supporting public health in the COVID-19 pandemic, and new data-driven evidence of the importance of paid leave, with support from the Washington Center for Equitable Growth, will enable researchers to continue studying how paid sick leave and paid family and medical leave can support workers, public health, and the economy in years to come.15
